

AMENDMENTS IN THE CLAIMS:

1. (Original) A data storage apparatus comprising:
a video signal receiving section for receiving a video signal representing video and aspect information to control aspect ratio of the video;
an audio signal receiving section for receiving an audio signal representing audio;
a detecting section for detecting the aspect information from the video signal;
a stream generating section for generating encoded data by encoding the video and audio signals by a predetermined encoding technique and also generating an encoded stream as a set of the encoded data;
management information generating section for generating management information which is used to manage process of the encoded stream, the management information including the aspect information for each set of the encoded data; and
a writing section for storing the management information and the encoded stream as at least one file on a storage medium.
2. (Currently Amended) The data storage apparatus of claim 1, wherein ~~when the~~ the set of the encoded data is treated as one sample~~[]]~~ and the management information generating section generates ~~common the~~ aspect information for the video ~~in each sample~~ on a sample-by-sample basis.
3. (Original) The data storage apparatus of claim 2, wherein when a plurality of samples are treated as one chunk, the management information generating section generates common aspect information for the video in each chunk.
4. (Original) The data storage apparatus of claim 3, wherein the management information generating section generates and stores the aspect information in a field of the management information for describing an attribute of each said sample.

5. (Withdrawn) The data storage apparatus of claim 4, wherein if the at least one file is compliant with the QuickTime standard, then the field is a Sample Table Atom (stbl) field, and

wherein if the at least one file is compliant with the MP4 standard, then the field is a Sample Table Box (stbl) field.

6. (Original) The data storage apparatus of claim 3, wherein the management information generating section generates and stores the aspect information in a field of the management information for describing user data with respect to the encoded stream.

7. (Withdrawn) The data storage apparatus of claim 6, wherein if the at least one file is compliant with the QuickTime standard, then the field is a User Data Atom field, and

wherein if the at least one file is compliant with the MP4 standard, then the field is a User Data Box field.

8. (Withdrawn) The data storage apparatus of claim 4, wherein the management information generating section further stores access information, which is needed in accessing each said sample to which the aspect information is applied, in the field, the access information including at least one of the number of samples included in the chunk and the playback duration, data storage location and data size of each said sample.

9. (Withdrawn) The data storage apparatus of claim 1, wherein the video signal includes copy information indicating whether the video signal may or may not be copied, and

wherein the detecting section detects the copy information from the video signal, and

wherein the management information generating section further generates copy control information as another piece of the management information, the copy control

information including copy protection information, showing a method of protecting the encoded stream from being copied in accordance with the copy information, and status information indicating whether the copy protection information is valid or not.

10. (Withdrawn) The data storage apparatus of claim 9, wherein if the copy information indicates that copy of the video signal is permitted at least once, then the management information generating section generates the copy control information.

11. (Withdrawn) The data storage apparatus of claim 10, wherein the management information generating section generates common copy control information for the video in each said sample.

12. (Withdrawn) The data storage apparatus of claim 11, wherein the management information generating section generates common copy control information for the video in each said chunk.

13. (Withdrawn) The data storage apparatus of claim 12, wherein if the at least one file is compliant with the QuickTime standard, then the management information generating section describes the copy control information in one of a Sample Table Atom (stbl) field and a User Data Atom (udta) field, and

wherein if the at least one file is compliant with the MP4 standard, then the management information generating section describes the copy control information in one of a Sample Table Box (stbl) field and a User Data Box field.

14. (Original) A data storage method comprising the steps of:
receiving a video signal representing video and aspect information to control aspect ratio of the video;
receiving an audio signal representing audio;
detecting the aspect information from the video signal;

generating encoded data by encoding the video and audio signals by a predetermined encoding technique and also generating an encoded stream as a set of the encoded data;

generating management information which is used to manage process of the encoded stream, the management information including the aspect information for each set of the encoded data; and

storing the management information and the encoded stream as at least one file on a storage medium.

15. (Currently Amended) The data storage method of claim 14, wherein ~~when the~~ the set of the encoded data is treated as one sample~~(,)~~ and the step of generating the management information includes generating ~~common~~ the aspect information for the video ~~in each sample on a sample-by-sample basis~~.

16. (Original) The data storage method of claim 15, wherein when a plurality of samples are treated as one chunk, the step of generating the management information includes generating common aspect information for the video in each chunk.

17. (Original) The data storage method of claim 16, wherein the step of generating the management information includes generating and storing the aspect information in a field of the management information for describing an attribute of each said sample.

18. (Withdrawn) The data storage method of claim 17, wherein if the at least one file is compliant with the QuickTime standard, then the field is a Sample Table Atom (stbl) field, and

wherein if the at least one file is compliant with the MP4 standard, then the field is a Sample Table Box (stbl) field.

19. (Original) The data storage method of claim 16, wherein the step of generating the management information includes generating and storing the aspect

information in a field of the management information for describing user data with respect to the encoded stream.

20. (Withdrawn) The data storage method of claim 19, wherein if the at least one file is compliant with the QuickTime standard, then the field is a User Data Atom field, and

wherein if the at least one file is compliant with the MP4 standard, then the field is a User Data Box field.

21. (Withdrawn) The data storage method of claim 17, wherein the step of generating the management information further includes storing access information, which is needed in accessing each said sample to which the aspect information is applied, in the field, the access information including at least one of the number of samples included in the chunk and the playback duration, data storage location and data size of each said sample.

22. (Withdrawn) The data storage method of claim 14, wherein the video signal includes copy information indicating whether the video signal may or may not be copied, and

wherein the step of detecting includes detecting the copy information from the video signal, and

wherein the step of generating the management information further includes generating copy control information as another piece of the management information, the copy control information including copy protection information, showing a method of protecting the encoded stream from being copied in accordance with the copy information, and status information indicating whether the copy protection information is valid or not.

23. (Withdrawn) The data storage method of claim 22, wherein if the copy information indicates that copy of the video signal is permitted at least once, then the

step of generating the management information includes generating the copy control information.

24. (Withdrawn) The data storage method of claim 23, wherein the step of generating the management information includes generating common copy control information for the video in each said sample.

25. (Withdrawn) The data storage method of claim 24, wherein the step of generating the management information includes generating common copy control information for the video in each said chunk.

26. (Withdrawn) The data storage method of claim 25, wherein if the at least one file is compliant with the QuickTime standard, then the step of generating the management information includes describing the copy control information in one of a Sample Table Atom (stbl) field and a User Data Atom (udta) field, and

wherein if the at least one file is compliant with the MP4 standard, then the step of generating the management information includes describing the copy control information in one of a Sample Table Box (stbl) field and a User Data Box field.

27. (Previously Presented) A data playback apparatus comprising:
a reading section for reading an encoded stream as a set of encoded data and management information which is used to manage process of the encoded stream from a storage medium, the encoded data including a video signal representing video and an audio signal representing audio that have been encoded by a predetermined encoding technique;

a decoding section for decoding the encoded stream into the video signal and the audio signal;

an extracting section for extracting aspect information, which is defined for each said set of the encoded data to control the aspect ratio of the video, from the management information; and

a superposing section for outputting the aspect information after having superposed the aspect information on the video signal.

28. (Previously Presented) A data playback method comprising steps of:
reading an encoded stream as a set of encoded data and management information which is used to manage process of the encoded stream from a storage medium, the encoded data including a video signal representing video and an audio signal representing audio that have been encoded by a predetermined encoding technique;
decoding the encoded stream into the video signal and the audio signal;
extracting aspect information, which is defined for each said set of the encoded data to control the aspect ratio of the video, from the management information; and
outputting the aspect information that has been superposed on the video signal.

29. (Canceled)

30. (New) The data playback apparatus of claim 27, wherein the set of the encoded data is treated as one sample and the aspect information for the video is further defined on a sample-by-sample basis.

31. (New) The data playback method of claim 28, wherein the set of the encoded data is treated as one sample and the aspect information for the video is further defined on a sample-by-sample basis.
